The effect of a new aldose reductase inhibitor (SR 31787) on the hyperglycemia and increased lipid level in streptozotocin diabetic rats. The effect of a newly synthesized aldose reductase inhibitor, SR 31787, on hyperglycemia and increased lipid level in diabetic rats was investigated in this study. Oral administration of SR 31787 for 5 weeks produced an effective reduction of blood glucose levels in streptozotocin-diabetic rats. The levels of triglyceride and cholesterol were also significantly decreased by SR 31787 treatment. The improved hyperglycemia and increased lipid level by the SR 31787 treatment was associated with a significant decrease in glycogen phosphorylase activity. These results indicate that SR 31787 may be an effective agent in the treatment of diabetes mellitus.

1. Field of the Invention The present invention relates to a plug connector for a flat cable having a plurality of twisted pairs of signal wires.

2. Description of the Related Art Japanese Unexamined Patent Application Publication No. 2013-67018 describes a plug connector for a flat cable. The plug connector includes a base member, an insulator that is inserted into the base member, a housing that is fitted into the insulator, a plurality of terminals that are mounted in the housing and to which signal wires of the flat cable are connected, and an insulating cap that is fitted into the insulator. The insulating cap covers a front side of the insulator.

Specializing in Building and Energy Audits Energy Saving Technologies We are able to recommend and install a wide range of energy saving technologies, including: Energy Audits Thermal Imaging Wind Mitigation Thermal Storage Our energy auditing team are experts in energy audit technologies, energy management systems, and software that has the power to track and measure energy use to provide the best solution to each individual situation. We are experienced in the technology and know what it is capable of

male infertility: a review. Various studies have looked at the characteristics of human ejaculate in relation to infertility and its
treatment. Infertile men can be classified into various subgroups, according to whether they are fertile or azoospermic.
Azoospermia is defined as the absence of ejaculated spermatozoa, due to testicular or ejaculatory obstruction. It is generally
accepted that the seminal components present in the ejaculate are derived mainly from the epididymal epithelium and ducts,
and from the spermatozoa themselves. The seminal fluid is mainly a mixture of water, ions, metabolic enzymes, and proteins,
the latter of which are responsible for a large proportion of its viscosity. The pH, which is lower in the ejaculate 2d92ce491b
