
MTC Pronest 8.02.01 [Latest]

* **`pip`** : Local binaries for Python are organized into a pip-specific virtual environment, allowing users to work without having to manage multiple environments and copies of Python. * **`pipenv`** : A new Python package manager that allows users to work with environments in a way similar to virtual environments. * **`jupyter`** : A Jupyter Notebook is a web application that includes a web server, a kernel, a user interface and, most importantly, the backend components (a kernel manager and a notebook server). * **`ipython`** : A powerful IPython Notebook environment with built-in support for Jupyter. This book assumes that you have some background in Python, especially if you want to work with **machine learning** (**ML**) tools like Kaggle Notebooks. If you don't have the necessary background, you will find a set of exercises at the end of each chapter to help you get started. In this chapter, we will cover the first three topics in the list. # Installing Python The Python installer includes a number of tools that are useful for ML: * **`pip`** : An easy-to-use package manager. The pip command allows you to install or uninstall packages or libraries. * **`pipenv`** : The pipenv tool allows you to manage multiple Python environments. * **`jupyter`** : A web-based interface for Jupyter Notebooks. * **`ipython`** : An open source Jupyter environment and the core of the Kaggle Notebook environment. ## Installing pip `pip` is the package manager of choice for many developers, so let's start by installing it using Python. On Windows, you can use the `pip` installer located in the Python installation directory, which is `C:\Program Files\Python\`_x.y_ on Windows. On Linux, this is `/usr/local/lib/python3.6/dist-packages/`_x.y_ on most versions of Ubuntu. It's also possible to install `pip` with `pip` directly. We will start by testing if we have pip installed

on our machine using the
