After the PrP<sup>Sc</sup> was cleared from the brain, the cells died, some of them releasing PrP<sup>C</sup>. Only the membrane-bound epitope of PrP<sup>C</sup> was detected in our study. This result is consistent with the previous findings that PrP<sup>C</sup> has a high chance of being digested by proteinase K.[@b9-dddt-9-163] In summary, we validated the specificity and sensitivity of the ORF3-TES antibody. We also demonstrated that the membrane-bound epitope of PrP<sup>C</sup> undergoes proteolytic cleavage during infection, which is useful in screening for PrP<sup>Sc</sup>. The membrane-bound form of PrP<sup>C</sup> in our model confirmed the proposed co-translational cleavage of PrP<sup>C</sup>, which could be helpful in understanding the mechanism of the membrane-bound PrP<sup>C</sup> generation. The association between PrP<sup>Sc</sup> and PrP<sup>C</sup> was also investigated using the ORF3-TES antibody and an in vivo model. The findings suggested that the formation of the PrP<sup>C</sup>-PrP<sup>Sc</sup> complex is based on the direct membrane-bound interaction of PrP<sup>C</sup> and PrP<sup>Sc</sup>, not on the indirect interaction via the host cell. The results also indicated that the structure of the transmembrane region of PrP<sup>C</sup> is probably affected by the formation
