Download them at no cost. You can read without registration. Members of the Ontario Institute for Cancer Research (OICR) Tumour Immunology Program have developed a specialized instrument that optimizes detection and isolation of circulating cancer cells from a patient's blood. Now, OICR researchers, in collaboration with the University of Pittsburgh's Institute for Cell Engineering (ICE) and the University of Pittsburg School of Medicine, are reporting details of the device in Nature Medicine. "Cancer is characterized by metastasis," explains OICR Program member and professor of Medicine, Michael B. Courtenay, Ph.D. "Even at the earliest stages, cancer cells can already have escaped from a primary tumour. These free-floating cells then travel to distant locations and seed the secondary tumour. This allows for the rapid evolution and metastasis of malignant disease." To fight this progression, it is important to understand the biological characteristics of the cancer cells that are spreading to distant locations, but researchers say that in order to obtain reliable information, you must be able to detect and isolate circulating cancer cells from blood samples. The new device, says Dr. Courtenay, "is able to detect cancer cells at the micro- 2f92ce491b
