Pyaar Ka Punchnama 4 download 720p BluRay.Q: Why is the returned address from malloc() non-deterministic I am a newbie in C programming language. I want to know why the returned address from malloc() is non-deterministic. I have created a function that allocate some memory dynamically using malloc(). int *f() { int *a = malloc(sizeof(int)); a[0] = 1; return a; } int main() { int *b = f(); printf("%d ", *b); return 0; } If I re-run the program with the same input, the output would be different. If I compile it, and run with gdb: (gdb) run Starting program: /home/namu/a.out Breakpoint 1, main () at a.c:5 5 int *b = f(); (gdb) r Breakpoint 1, f () at a.c:5 5 int *a = malloc(sizeof(int)); (gdb) p *b \$1 = (int *) 0x7fff5bfff5e8 (gdb) p *a \$2 = (int *) 0x7fff5bfff5e8 It seems that I did not see the same allocated memory address. Is it because the OS doesn't use the same block of memory to allocate memory? 2d92ce491b
