Toyota Soluna 1.5 Injection Second Model. Clean interior, no dents or dings. Fast and reliable service. As the related art, a projection type image display device (projection type display device) is known, which displays an image on a screen by projecting an image light projected from a light source by a lens (projection lens) onto the screen. Such a projection type image display device includes a light source lamp, a reflector, and the like as the light source. In the image display device, light from the light source is reflected by the reflector, and the reflected light is incident to the projection lens. The projection lens forms an image of the incident light on the screen. In such a projection type image display device, if the ambient temperature of the projection type image display device increases, a temperature of the light source lamp also increases, and as a result, the amount of light of the light source lamp also increases. For example, in a case where the projection type image display device is used in a condition of high temperature or high humidity, when the light source lamp is caused to increase its light amount, the power consumption of the light source lamp increases due to the increase in the light amount. In order to suppress the increase in the power consumption due to the increase in the light amount of the light source lamp, the projection type image display device includes a light source drive circuit that controls the light amount of the light source lamp. In a projection type image display device having the light source drive circuit, when the ambient temperature of the projection type image display device increases, the light source drive circuit increases the light amount of the light source lamp by increasing the amount of current of the light source lamp. The increase in the light amount of the light source lamp is carried out within the range of light amount in which the image quality is not degraded. When the light amount of the light 2d92ce491b
