You can't do it from the main menu. The present invention relates to a method of making solidstate or flash-type amorphous explosive detonator compositions. More particularly, the invention relates to the use of novel low vapor pressure and viscosity liquid propellants as base materials for such compositions. One type of blasting explosive composition utilizes powdered oxidizer material, a detonating cord, and an elastomeric wad or pellet disposed between the detonating cord and the oxidizer material. As such, the oxidizer material, when detonated, produces an expanding shock wave which ruptures the detonating cord, thereby producing a high order detonation. In order to effect such an explosion, an explosive detonator or ignitor is used to initiate the detonation of the explosive composition. A detonator is a device placed in the explosive composition, such as a pellet, to initiate an explosion. One type of known detonator, which has been used for many years, consists of a cap of plastic explosive material, such as plastic explosive material based on hexogen, and a slug of wax material, such as wax-based plastic explosive material. The explosive detonator, when initiated, melts the wax and the plastic explosive material becomes molten and expands. When the plastic explosive material expands, it forms a high pressure gas, in turn expanding the casing material surrounding the plastic explosive material. A problem with this type of detonator is the inability of the explosive composition to retain the molten wax-based explosive material. The molten wax will typically seep through the plastic explosive material, thereby reducing the effective life of the detonator. Attempts 2d92ce491b
