The Samsung Exynos 5 chip used in the phone only gave 13-megapixel images, while the A5 in the iPhone 5S took 21-megapixels. A year later, the situation has only got worse. On Thursday, Samsung announced that the Galaxy Note 3 will be using an Exynos 5 Octa processor, but its camera will only be able to record at up to 12-megapixel. The news came after a leak on Samsung's Korean site where it was announced that the Note 3 will be using a Exynos 5 Octa processor, which will have eight cores compared to four in its predecessor, the Galaxy Note 2. Although the camera in the phone will still be a five-megapixel f/2.0 unit with optical image stabilization, the rest of the phone should be just as powerful as the Galaxy S4, which contains an Exynos 5 Dual. While it may sound like the
