For example, we have a circle of radius 1 with a point P(2,0). We need to find the closest point Q to P in the same plane. The only answer I can find is to use the formula for the distance from a point to a circle but the equation would look like this: $r^2 = x^2 + y^2$. A: There is a fairly simple algorithm to do this: $(a1,a2)$ is the center of the circle, and x is the distance you are trying to find. Step 1: Subtract a1 from all the x-coordinates, and a2 from all the y-coordinates. Step 2: Sort the x-coordinates in increasing order, and the y-coordinates in increasing order. Step 3: Take the index of the largest (smallest in negative) y-coordinate. If the index is zero, then the closest point is the circle's center. Step 4: Take the index of the largest (smallest in negative) x-coordinate. If the index is zero, then the closest point is the circle's center. Otherwise, the closest point is the point whose y-coordinate is in the sorted y-coordinate index, and whose x-coordinate is in the sorted x-coordinate index. Q: pip install vwtk on ubuntu 13.10 I'm trying to install a python module called vwtk. I use python 2.7.5 and ubuntu 13.10. I can 2d92ce491b
