In the case of a.zip file, it can contain any number of files. A single file can be stored multiple times in a.zip file. This is explained in this question: What exactly does "Subfolder contained more than one file" mean in a.zip file? For your particular question: What all are the meaning of.txt extension? A.txt file is just a plain text file. What all are the meaning of.zip extension? A.zip file is also a container for a collection of files. The extension is "zipped". Multicore Architecture (MCA) is the architecture of a computer that employs more than one processing core to process parallel tasks. Multicore processors, i.e., the computing components that constitute a MCA computer, must be able to properly share access to the data bus. One challenge that has been faced is that of scheduling these tasks when a task is running in the processor that did not have access to the data bus while it was running. In MCA processors, task switching is done by the hypervisor, which typically stores the context of the currently executing tasks in the main memory. However, it is possible that the hypervisor can stall on a particular instruction that occurs frequently during the execution of a particular task. This stall can cause memory accesses to the main memory to be interrupted. In such a case, the proper scheduling of other tasks becomes very important since the processor has no way of knowing when the hypervisor will stall on the particular instruction that is frequently occurring. In order to make sure that the right task will get the right amount of attention at the right time, the task scheduler can use heuristics to guess the next task to execute. However, the heuristic used by the task scheduler 2d92ce491b
