Category:1954 births Category:Living people Category:Romanian veterinarians  
Category:People from Sibiu CountyThis invention relates to a packaging machine, and more particularly to a machine for packaging stacked containers having a gabled edge on the top of the container and also having a hinged cover to close the container. Containers for beverage products, particularly those intended to be consumed with food products, have a gabled top which covers the edge of the top of the container. For example, cans are manufactured having a gabled top for this purpose. To close the container, it is common practice to simply fold the cover over the gabled top and to apply a rivet or the like to the gabled top and the end of the cover so that the cover is secured to the gabled top. With these covers, however, it is difficult to install the cover on the gabled top, particularly if there is a wide variety of containers to be packed. In addition, the closure mechanism typically is of complicated construction and requires a great number of parts, which is undesirable. It is a general object of the present invention to provide a machine for packaging stacked containers which has a cover hinged to the containers so that the cover may be opened and closed without the cover having to be in a separate action before the cover is attached to the container.

The lack of a suitable substitute for brains has plagued the field of artificial intelligence. That has prompted a flurry of research into how a device might be able to perform complex tasks such as reasoning, and which has led researchers to emphasize the importance of machine learning and deep learning. The short answer is: lots of neural networks, deep learning and reinforcement learning, from both academia and industry. In fact, it has been almost impossible to ignore that these technologies have emerged as the main catalysts for the rapid growth of artificial intelligence. In his book, "The Rise of Artificial Intelligence," AI researcher and Stanford professor Michael Jordan says deep learning is what's taken AI from the concept to the application stage, and that it has been responsible for rapid advances in tasks like speech recognition, image recognition, and machine translation. "It is the deep-learning revolution that has brought AI to the level of practical, everyday uses," he writes. It is also a revolution that is proving difficult to predict. The World Economic Forum's newly released Future of Jobs report highlighted a number of jobs that it said are highly
