Adobe Photoshop Elements Most people consider Photoshop to be the heavy hitter when it comes to image editing, but Elements is a simpler image-editing program that's easy to use. It costs less than Photoshop. (The full version of Photoshop costs \$599 for a single user or \$799 for a three-user license.) Elements is based on Adobe Acrobat, which means that you can use it to create presentations and brochures as well as edit images. (See Chapter 19 for more about using Acrobat.) You also have

What are the differences between the full version and Elements version? Adobe Photoshop is a high-end, professional image editing application. It can handle pretty much any kind of image editing task you need to do. It has an extremely powerful

---

feature set, allowing you to work with color, layers, and textures to become a professional photo editor. With Photoshop Elements, on the other hand, you are limited to adding a few of the features mentioned above. If you need to edit your images, you can always use the full version of Photoshop to do the work. We also included a comparison of some popular features for both versions in the table below. We have included a small comparison of features in the table for each application.

Q: Why would Moon dust impact a satellite? If we have the apollo 16 landing and then the astronauts are airborne. They have a brief moment to look down and notice moon dust on the plane. But why would dust make it's way onto an object in orbit? Wouldn't the moon dust be effectively just vaporized by the heat of the engines and not much be left to impact the spacecraft? A: The moon has abundant supply of carbon-based matter, both inside the crust and in the mantle and core. Carbon compounds are not stable at high temperatures, but are also electrochemically active and reduce to the metal in that range. There are two forms that react with each other depending on their state, which makes the formula to produce the volatile: copper(I) sulfate  $\text{Cu}(\text{SO}_4)_2 \cdot \text{Cu} =$  copper(II) hydroxide  $\text{Cu}(\text{OH})_2$  copper(II) chloride  $\text{Cu}_2(\text{Cl})_2 =$  copper(I) chloride  $\text{CuCl}$  This separation is slow

---

and limited, but it means that moon dust can be a source of copper. The reaction to form copper is exothermic. Furthermore, it's not only carbon that reacts, it is also nitrogen, oxygen, sodium, potassium, phosphorus, sulfur and even a couple of silicon compounds. Not all compounds form, and not all react, but just to mention a few: there's  $\text{N}_2\text{O}_2$ ,  $\text{SO}_2$ ,  $\text{N}_2\text{O}_4$ ,  $\text{CO}_2$ ,  $\text{NO}_2$ ,  $\text{NH}_3$ ,  $\text{NH}_4^+$ ,  $\text{HNO}_3$ , etc. I have seen these reactions on the Web and simulations online, but I've not seen a good source that shows a reaction graphic for each of them, so I'll have to dig to find it. It's common to use the following formula to explain.  $T$  is in Kelvin, and  $A$  the energy needed to remove an electron from the substance,  $K$  the equilibrium constant and  $B$  the bonding energy,  $N$  is Avogadro's Number,  $F$  the Faraday Constant and  $L$  the molar concentration. Q: How to connect to Alexa Skill from different ip address (Port not used by Amazon) I need to use Alexa with a bot. I can make a connection as a "human". However when I use a computer which is not connected to the internet (even use VPN), Alexa complains: {"error":{"type":"InternalServiceError","message":"Unable to determine skill messaging endpoint for media type: 'application/x-amz-lex-unsupported-model-type'"} } I'm not really sure what to search for. I have checked that the port number is not used by amazon for phone and text messaging. Is there a way to create an app where I can provide an ip address or subnet to connect to? A: Amazon is blocking your "port number" for phone and text messaging, therefore

---

you cannot connect to it from a computer on the internet. You will need to connect to the Alexa service from a computer on the same IP network on which the Alexa app and the Alexa device reside. If your IP address is in the same network on which you have a cellphone, you should be able to connect from that computer. Otherwise, you can purchase an Amazon Fire Stick or tablet to connect to the Alexa service from the internet. If your IP address is in a different network, you can use an EC2 instance to connect to the Alexa service. You can read the documentation here (searching for "skill" in the "open services" section) for details on how to do that. If you do that, keep in mind that some EC2 instance types have very limited network connectivity, so you may want to get an "General Purpose" instance type.
