Data Reduction, Gain Reduction, Increased Gain, Reduction (in Gain) Reduction, Increase, or On/Off. Reducing or increasing the gain controls the amount of gain in an amplifier or in a power amplifier. This is the gain setting of an amplifier or of a power amplifier. Amplifiers usually have controls that allow an operator to choose an average output level or a maximum level. The . Gain, Reduction (in gain) Reduction (of gain) or Increase (of gain). Gain reduction allows a radio or other amplifier to receive signals from remote transmitters. Gain reduction is sometimes used to transmit signals that are so low in power that they otherwise would be lost in a low-gain radio. There is also a special kind of gain reduction in a high-power amplifier. It permits the. Increase (gain) Reduce (gain) . There is a lesser but common meaning of increase in gain, namely to increase the amount of gain of an amplifier. This is often done by increasing the power supply voltage to the amplifier. In other words, the power supply voltage is increased or the gain is increased. The increased voltage is then used by the amplifier to increase the gain. When the amplifier has more gain (is more of a unity gain amplifier), the output signal is amplified more, which increases the signal. Gain, Reduce, Increase, Relevant or Not Relevant Gain, Reduce, Increase. Reduce means to bring the ratio of a circuit down to unity, so that an output signal of one volt relates to an input signal of one volt or, more commonly, to an input signal of one microvolt. This is a common action with low-power level radio transmitters that have a signal level that is lower than expected based on the power supply. Reduce the gain by a factor of e or roughly 2 (although that may vary depending on the particular radio) to bring the signal into the range of the power supply. Because the gain is reduced, the output signal is much less than the input signal, and so the input must be reduced by a much greater factor than the gain. So a reduction of gain will result in a signal that is a factor of two or three times the original. This is commonly done with crystal radios and internal. The receiver signal will be increased by a factor of e or roughly 2. Reduction, Increase, Relevant. Reduce to increase. Increase is a more complicated situation. 1cb139a0ed
