FREE!ship is a FREE surface modeling tool for the design of all kinds of watercraft. It uses a subdivision surface model to simulate the hull. It's designed to be easy to learn and the instructions are in the program itself. It's easy to customize the surface. In fact there are many possibilities for tweaking the surface with many free modules and addons available. It's not only good for designing rudders, but also fixed and retractable rudders. It's easy to design variations like underwater extension, fin tips, blisters, rudders and various other watercraft features. There's even an option to simulate pitch or trim planes that make the surface act more like a plane or a ship with the amount of curve in the hull. Free!ship has a lot of options. You can create parts and then combine those parts to create an integrated hull. You can make the hull out of many different parts such as: The deck, the hull, the bow, the outboard sides and the tail. There are tons of options to customize the surface. Creating a model of the hull requires a surface model and the ability to combine that model with a deck. There are multiple views available that gives you a 3d view or a more accurate 2d view of the model. We have included a full set of CAD drawings of a hull and a full set of CAD drawings of a deck to give you a starting point for designing your own boat. Free!ship Features: There are 4 ways to start designing. 1. Using the interactive view that makes it easy to see what the hull will look like. 2. Using the preview image view that gives you an instant preview of what the model will look like before you place the parts. 3. Using the 3D view that gives you a more accurate 3d view of the model. 4. Using the 2D view that makes it easy to place parts. The Surface view is one way to customize the surface. There are free modules available to make a retractable rudder or a retractable rudder on a plane. There are also many options to make that surface curve, act like a boat or make it float. Free!ship features: 1. Interactive surface view 2. Preview View 3. 3D View 4. 2D View 5. Surface Modification 6. Smooth Surface view 7. OCLC 2D view

...think process, the creative design process can be understood to involve an undulatory process of flow of ideas, data, schemas, and the exchange of meaning, reinterpretation, and reconsideration. That being the case, this model embodies the notion of a flow of data... ...and usability. WHAT WOULD YOU LIKE TO SEE IN THE PAGES OF A DESIGN SOFTWARE THAT APPLIES TO PRINTING? A design process does not end after the page layout. It continues all the way from the planning of the concept, design and modeling, through design review, cutting, laminating, painting and assembly. All of this work is part of a single process of making the product. This model was designed to assist the end user of a design software that supports a printed product. That end user will need to integrate the cutting, painting, assembly and packaging (if appropriate). HOW DOES THIS PRODUCT ASSIST A DESIGNER? The model demonstrates the work flow of a product that has been designed in a design software that supports printed products. The software supports the design of a new product. All the functions that a designer might need are supported by the software. HOW DOES THIS MODEL FIT INTO A DESIGN PROCESS? This model was designed to be part of the flow of data and meaning of a design process. The designer uses the software to plan, model, and review the data. The software supports the generation of all the information that a designer might need to make a decision about the design. That is the basis for the next flow of data, the information that will be used to plan, model and review the design. The end result is a decision to refine the design. HOW DOES THIS MODEL SUPPORT THE DESIGNER? You could use this model to understand how the design process fits into a software that supports a printed product. You could also use this model to communicate with a graphic designer or an industrial designer about the application of print design principles to a new product. You could also use this model to explain your design process to a person who will help you with the print production. WHAT IS IN THE MODEL? This model is a graphic representation of the design process for a new product. The model is a 3D scene with text, graphics, and pictures. The model does not contain any information about the design software. That is information that is available in a manual. The model is not a "package" that the designer has 77a5ca646e

FreeShip is a surface modeling program for designing all sorts of water crafts. Subdivision surfaces are used rather than NURBS to give the designer the freedom to design any desired hullshape. The program is oriented to industrial and naval designers. FreeShip is a true 2D design package where the designer can use the 'flat' CAD interface to set up the hull outline and plan his choice of displacement surfaces. The program then calculates all the necessary calculations and results are ready to view in 3D. FreeShip does not apply a rigging to the models. The displacement hull surface and flat bottom plane are rotated along with the craft to achieve pitch and roll. FreeShip uses Computer Aided Design (CAD) data files to generate the hull shape and perform all calculations. FreeShip can be run as a standalone application. FreeShip can be used as part of the FreeCraft package. FreeShip supports most of the popular CNC machines. You can also use existing models such as IBS, Optimatrix, Dassier, or Voldin's. Also most hull design free and commercial CAD programs can be used for hull design. FreeShip uses multiple views for viewing results. You can also interactively rotate the hull surfaces and play with the freeform hull surfaces. FreeShip uses a new advanced CAD concept which is well described in the following papers: B.L. Heisey, P.A. Lindstedt, R.G. Poulter, The use of 'free-form' and 'regional' surfaces to predict the performance of ocean-going ships, WSEAS Transactions on Engineering Sciences, 30 (8), 717-724, 2015. B.L. Heisey, P.A. What's New in the FREE!ship?

FREE!ship is a surface modeling program for designing all sorts of water crafts. Subdivision surfaces are used rather than NURBS to give the designer the freedom to design any desired hullshape. Full support of all boat parts allows you to load boat CAD data from Autodesk Inventor, Solid Works, Creo, etc. The FREE!ship includes the following modeling packages: - hull design (the part of the watercraft that is above the waterline) - deck design (the part of the watercraft that is below the waterline) - foundation design (the part of the watercraft that is below the waterline) - internal design (comprises electronic engine and computer equipment) - electrical design (comprises all electrical devices in the watercraft) - all other parts of the watercraft including deck and hull FEATURES OF FREE!SHIP - added complexity (uses "surface subdivision") that allows you to design any possible hull shape - modeling (the part of the watercraft that is below the waterline) is based on surface modeling (Surface subdivision) - various quality levels (from basic to advanced) - many types of connectors (for electrical cables, plumbing, etc.) - unlimited parts (yes, you can make a watercraft with literally millions of parts!) - unlimited number of hull shapes - unlimited number of hull connections (inter-connection of the various parts of the watercraft) - unlimited number of decks (different types, shapes, etc.) - unlimited number of bays and draft compartments (rare nowadays; the possibilities are endless) - support for the foundation of the watercraft (important for architects) - support for the deck (again, important for architects) - support for the motor, engine and instruments (important for designers and boat mechanics) - unlimited number of portholes - unlimited number of hull shapes - unlimited number of ballast compartments - unlimited number of drafts (different types and sizes) - unlimited number of rowing spaces - unlimited number of cabins - unlimited number of captain's quarters - unlimited number of saloons - unlimited number of storerooms - unlimited number of deck shapes - unlimited number of deck features (a cabin of various types, etc.) - unlimited number of deck elements - unlimited number of deck connectors - unlimited number of deck panels - unlimited number of tunnel pieces - unlimited number of deck hatches - unlimited number of hatch covers - unlimited number of storeroom components - unlimited number of watertight doors - unlimited number of window elements (panes and glass) -

Discovery Quest 4 is a platform game developed by Power Quest. The game was first released on Apple II and MS-DOS in 1989, followed by a conversion to Apple Macintosh in 1990 and MS-Windows 3.11 and OS/2 in 1991. For a platform game, it was an unusually faithful conversion, which is why it is still worth playing today. In addition to the Apple II version, the DOS version was ported to the Amstrad CPC, BBC Micro, Commodore 64, ZX Spectrum and MS-DOS. The Apple II version of Discovery Quest 4 is
