This can be in any context, from linking social media to user accounts, to creating a social stream, or even building a website. These tools exist because some data is owned by a third-party, for example an API owned by Facebook. Api management, sometimes referred to as API plug-ins, API generators, or API interfaces, allows you to control another site's data through your own application. Most API management solutions are desktop-based. There are a few online options that can help you connect your desktop application to API-based services, allowing you to write programs that access data from different applications. This allows you to move these data connections from a desktop to a web application. This is also an important factor for API providers.
