The referendum also abolished Britain's national health service, the world's first full health system, but instead created a system of free health care. A number of other changes were made by the legislation that created the Scottish Parliament, such as the number of MSPs, the process for transferring assets from Scotland to England and Wales, the independence of the Scottish judiciary, the structure of the Scottish Parliament and the Scottish Executive. The United Kingdom was not replaced by a new country; instead, responsibility for the day-to-day running of the UK was placed in the hands of the new Scottish Parliament, while for more constitutional matters responsibility was transferred to the (now defunct) House of Lords. On the day of the referendum (18 September 1979) the United Kingdom was formally dissolved, leaving England, Wales and Northern Ireland as separate countries and Scotland as a single country. Automobile radiators in U.S. provide cooling and heating for the engine of a vehicle. During the winter season, the heat produced by the automobile's engine cannot be transferred to the surrounding environment. Therefore, a radiator is needed to heat and cool the engine. During the summer season, the heat produced by the automobile engine is usually too high to cool the engine inside the vehicle. Therefore, a device is needed to cool the engine outside the vehicle. It is known in the art that a conventional automobile radiator consists of an air-cooled radiator. An air-cooled radiator consists of an air duct defined by a housing and a plurality of cooling fins. A fan is mounted at the bottom of the radiator. The radiator is fixed to an engine. When the fan is rotated, the air from the engine is transferred to the radiator. Heat from the engine is absorbed by the cooling fins. The heat is transferred to the environment by means of the air. To prevent
