Initially developed and marketed by Autodesk as a desktop app running on microcomputers with internal graphics controllers, the software was first released in December 1982. Prior to AutoCAD, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal, or on smaller systems where each operator worked at a shared graphics terminal. The first version of AutoCAD was a graphics-intensive desktop app with a command-line interface. It was designed to run on 8088-compatible 8-bit microcomputers with 4 megabytes of memory. The application was written using the high-level language Simula and could read data files formatted using its proprietary Graphics Language (GFL). The application was designed to support only line, curve, and arc drawing, and to automatically create the structures that enclose 3D drawing objects (such as walls, floors, roofs, and windows). The program generated the 3D geometry of an object as a network of polygons and their attributes, and stored the data in a file format called Graphics Language for Computer-aided Design (GFL/CAD). GFL/CAD included commands for defining line and arc primitives, as well as commands for defining and editing objects such as walls, floors, and windows, and for editing and changing the attributes of these objects. The program could also create layers and store them in a file, allowing the designer to define groups of objects as either hidden or visible in the drawing. AutoCAD could then be used to create and edit the objects in the layers. In addition to the GFL/CAD format, AutoCAD generated a graphics standard file format known as the Graphic Data Language (GDL) for use with external graphics terminals, and later with three-dimensional (3D) graphics hardware. In the early 1980s, microcomputers running the 80286 and 80386 processors became common. In 1983, Autodesk released version 2.0 of AutoCAD, which supported multiprocessor systems with up to 256 megabytes of memory. With this

External scripting languages. AutoCAD supports several external scripting languages: AutoCAD uses VBScript for scripting. The code must be developed and compiled to a file (cscript.exe), then executed. AutoLISP or AutoVP, is used to extend AutoCAD capabilities through the AutoLISP programming environment, which is similar to Visual Basic. AutoLISP was the default scripting language for AutoCAD until version 10. AutoLISP can be used to script AutoCAD commands or even add new commands. AutoCAD can be scripted using the .NET Framework. ObjectARX, is a C++ class library. It is a common base for applications that run in AutoCAD. AutoLISP AutoLISP was the first of the external scripting languages supported by AutoCAD. The script is written in text files. It is an interpreted, high level language, similar to BASIC, but with a few more features. AutoLISP is one of three AutoCAD External Tools scripting languages that require the use of a separate "cscript.exe" command-line compiler to convert the script to a binary executable. Like Visual Basic Script, it is a high-level, interpreted, dynamic programming language that runs in the Microsoft Windows operating system, which is commonly used by AutoCAD users. AutoLISP supports up to 64,000 script commands (commands are also called "functions") or actions. By default, the AutoLISP functions execute one after the other. A feature known as function calls allows functions to be called in parallel (that is, several functions can be executed at the same time). This language was replaced by VBScript in AutoCAD 2000 and later releases. AutoVP The newest, most powerful script is AutoVP or AutoVP Professional. AutoVP is a proprietary programming language that runs under the .NET Framework on Windows platforms. It can run AutoCAD commands or add new AutoCAD commands. It has a scripting engine that works faster and more effectively than that of the previous AutoLISP version. AutoVP supports hundreds of thousands of actions or AutoCAD commands.
