AutoCAD has provided a number of technologies for GUI customization. These include: Visual LISP, VisualStudio Script, XML, MHTML and LOD (Local Object Descriptor). AutoCAD has a number of features supporting customization and automation in the application itself. Some of the common automation used by AutoCAD's own C++ functions include: Serialize and deserialize XML (ASMX, XSDM, XMLDS), LOD (ASLOD), Programming Interfaces (API). All of the customization options in AutoCAD are organized into a series of layers: “Engine,” “UI,” “Application,” “Graphics,” “Net,” and “Plugins.” Layers of customization are built using a hierarchical organization. There are also some cross-platform customizations available, such as DirectML, DirectX and HTML/ASP. AutoCAD is bundled with both classic and modern theme and colors. Many aspects of the application are customizable, such as the brushes, fonts, menus and toolbars. These can be customized by a user. The customization settings in the program are stored in the preferences. A third-party extension may also be able to customize aspects of the program. AutoCAD does not save a separate model workspace. Instead, it uses the workspace file (.DWG) to share model data with all drawings. All user-generated information, including changes to the current model, such as added lines, can be saved by copying the original.DWG file to a new location, with a new name. Data can be accessed through the interface,.NET or through API. The program allows user-generated data to be transferred to other systems using export operations, such as exporting to files or images. The animation system, based on TweenLite from Autodesk, allows users to animate the drawing of elements in a drawing, such as lines, circles and arcs. These tools are often used to create movies in Cinema 4D. Printing AutoCAD includes a choice of native DGN files, a file format that will be fully compatible with other programs using AutoCAD. The format is in two parts. The main part, the DGN, contains all the design information, which the software can understand. The second part is the SLD (Style Library Definition) and is a spreadsheet 5b5f913d15
