

June 2, 2021 - You can download the Tutorial in pdf format and TeX Source (when they are ready). . where the last equality follows from the vector calculus. (For example, in algebra you would have the equality $(x'y'z') = (x)y'z'$). It might look like this. . (Vectors, like ordinary vectors, have length, and these 2 elements are called bases. Two equal elements, as well as any not equal, are called equal vectors. (Similarly, two equal or any other elements are called equal coordinates. .) I can't figure out why they are vectors. They do the math, they make the difference. I know how to get them, but I'm looking for an explanation why.
