It supports hotkeys to quick launch programs, even if they are not installed on the system. The program can be set to launch at the desktop, tray, or logoff. You can assign tasks to run repeatedly, or only once, with a time delay. Different alarms can be set to notify you of a particular event.?" "Well I can make it mine and then release it to you." "Oh!" He said with a laugh, which made her smile a little. "How much will it cost me?" "It would be a small favor and is a gift." "I can't just sell a healthy little man to you, even if I wanted to, he is far too valuable to me." "I think that I can assure you that he is healthy." He chuckled a little before saying, "Sorry, but that won't work. My budget is tight right now and I have been having to sell off many of my personal things lately." She silently cringed but said nothing. "May I ask you one last question before I give you the contract?" "Sure, ask away." "His fate depends on this?" "Yes. As long as we both get what we want I will provide for him." "Is this your only connection to him?" "Yes, I do have a new baby to worry about. I know that he will be cared for but the responsibility is not something that I relish." She took a deep breath, this was becoming too complicated. "Okay, so what is the price and what would you want in return?" He frowned. "Not a good day for this?" She sighed. "It has nothing to do with that. I am just asking for clarification." "I will pay you ten thousand in cash." Her eyes widened. "Don't you have a small problem

The list continues (don't count) LXDE and Openbox are often the most used desktop environments in the modern age. Most Linux users today have experience with DE's that aren't as "modern" as the older LXDE and Openbox (e.g. Cinnamon). I hope to give a quick and easy walkthrough on how to make Openbox-Compositor work and get a feel for using Openbox-Compositor. I used the '8' kernal by Jon Rapport (I do not own the 8.0.3 kernal myself, I'm just hoping to help share this project. My personal review of this kernal is that it is the smallest of the three provided DE's. You will probably get a better experience with this OS if you download and install one of the other two (LXDE or Openbox). Each desktop environment (DE) works a little differently, so to my knowledge, this should work for all of them. What is Openbox-Compositor and why use it? Openbox-Compositor is a "View Manager". Advantages of a portable app Fully customizable tasks, and alarms Disadvantages of a portable app A cool thing about it is that it can be used on both your home, and work computers directly from a thumb drive, since it skips you the time, and effort needed to go through a setup process. Apart from flexibility, this also means that system registries remain intact, thus not affecting the PC it's used on. The application spends most of its time in the tray area, with no message, or tooltip to let you know it's there on start. It's the place where you can also access all editable areas, such as the memo, hotkeys, tasks, alarms, and the clipboard manager. Fully customizable tasks, and alarms The memo is a simple text editor, fitted with a writer pad, and a search tab. Text can't be customized to great lengths, with only a few preset visual style options. Documents themselves are stored in the same canvas, separated by a custom delimiter, with no built-in save, or export options. When it comes to hotkeys, these can be customized in quite the variety of ways. All special keys can be combined with a different button in order to launch custom tasks, or alarms, as well as handling different Windows core features, such as volume management, and others. Tasks benefit from the same deal of customization. The type is selected from a dedicated drop-down menu with options to add to clipboard, close program, execute script, lock the PC, log off, mouse click, open a file, reboot the PC, start, or stop alarm, and more. Depending on your choice, the set of controls, and requirement fields change accordingly. Last, but not least, reminders can be set so you don't miss any appointments. However, these provide more functions, with the possibility to show a message, play sound, repeat the alarm, or even run a task, which can mean just about anything.
