Technical illustration Technical illustration is the science of drawing or rendering for the technical aspect of an item, process or system. The term is often used to distinguish technical drawing from design (layout) drawings. In the technical illustration process, the designer works in coordination with a technical artist. A technical artist does not design the layout, nor does he or she translate it to a CAD system. The technical artist's main responsibility is to properly represent the design in a graphic medium that conveys a functional representation of the work. The term technical artist may not be an accurate term, as there are many types of technical artists, such as systems engineers, mechanical and electrical engineers, and others who work in an engineering environment. The process begins with the designer. The designer may be a professional, or may be a student, in which case he or she is supervised by a professional. A design may be in the form of a set of drawings, a specification, or a prototype. The designer typically draws the design on a sketch or mechanical drafting board. After the design is complete, the designer and the technical artist may work together to determine the details of the design. They typically do this using a technical manual, which is a collection of procedures, photographs and drawings that show the construction of the product. Sometimes the manual is published as a reference book. Technical illustrations are intended to be clear and concise, since the author has a limited ability to describe the design in detail. The technical drawings are very detailed. They may be reduced to scale models, such as a model of a bridge. The model is used by an engineer to check the operation of the design, or to ensure that the design will work as intended. In the mid-1970s, printed circuit boards (PCBs) first appeared. A designer would lay out the board as a mechanical layout, usually with the help of technical artists and engineers, and make any needed revisions to the layout. The technician would then draw the board based on the lay out, including component placement and connections. While there are clear differences between the board design and the board layout, the two activities are often performed simultaneously, for example with mechanical and electrical engineers working together to produce a board layout. The board layout can be re-engineered and re-drawn as many times as needed. Technical illustration is used in the manufacture of the product. For example, it can be used to illustrate an engineer's design of the assembly in the production engineering environment. Technical a1d647c40b
