This book guides you through all the basics, plus you get up-to-date images of the latest and most advanced techniques as Photoshop versions have improved.

DIALING IN THE FLAWS Photoshop enables you to add, remove, and modify objects, backgrounds, and even text, to give a new perspective to the image.

Following are three basic tools that can be applied to an image, with a few advanced tips as well: Duplicate: This tool enables you to clone (or duplicate) an object in the picture as a new image. You can

position the object just where you want it within the image. Pathfinder: This tool enables you to target an area of the image, to change the contrast and color, or to delete parts of the image. Lens Correction: This tool enables you to accurately map out and correct the distortion of the image in a horizontal or vertical direction (this is known as straightening the image). After you learn how to use these tools, you can duplicate, create layers, work with selections, and then create the kinds of multi-layer masks that you see in the following sections. After you get past these basics, you can apply more tools to fix an image, make it

look better, and give your artwork a realistic look. Detailed review of the most powerful Photoshop commands are given in Chapters 13–. **SCREENLIGHT** Most people are familiar with something called `_screenlight_` (the non-technical term for "mirror") and how it can be used to highlight the most important parts of an image to draw attention to them. If you weren't familiar with that term, you can use Photoshop's Screenlight tool. You can use Screenlight to apply a dark shadow that appears to cast a highlight on one area of an image; or you can highlight the entire area, including background, so that you can see the entire image more clearly.

To use Screenlight: **1.** In the Layers palette, click on the Screenlight button to open the screen: **2.** Drag to create a mask, enabling you to modify areas of the original image, or click in the area of the image that you want to modify to modify it. **3.** To change the intensity of the screen effect, choose Image⇒Adjust⇒Screen Lightness; or press Ctrl+Shift+8 to modify the screen

Q: Indicating the query position in SQLite
I have a table with string columns: id, name, attribute, attribute_id All 4 columns are of TEXT type. How do I SELECT the attribute in which the string starts (sqlite convention for SELECT)? A: SELECT * FROM table WHERE attribute LIKE '%string%' LIMIT 1; Works fine for me. Why didn't you use the above? Anyways, though, you can use offset for the next: SELECT * FROM table WHERE attribute LIKE '%string%' AND 1=2; It sounds as if your current

method won't work since the single parameter does not specify a position in the whole row. Another way to select from a certain point is to select the id and then have your program print the row in your code instead of doing it using the database. For example: `SELECT * FROM table WHERE id=1;` In my code I show the specific line of code that I select the data. Alcohol consumption and the risk of breast cancer. Case-control studies of alcohol consumption and breast cancer risk in white women have produced inconsistent findings. This inconsistency could result from the inability of these studies to assess the effects of alcohol on

subgroups of breast cancer based on age at diagnosis, extent of disease, hormone receptor status, or other pathological features. We tested the relation between consumption of alcohol and breast cancer risk in a cohort of young white women followed prospectively, and classified breast cancers into three subtypes by extent of disease, hormone receptor status, and age at diagnosis. We matched 1242 cases with women from the same cohort who were alive and free of cancer at the time the cases were diagnosed. Information on covariates, including physical activity, body mass index, and postmenopausal hormone use, was

gathered at baseline. Compared with no alcohol consumption, risk was increased among women consuming moderate amounts of alcohol (1-2 drinks per day), but not among those consuming high amounts of alcohol (greater than 2 drinks per day). A summary odds ratio for the highest compared with the lowest category of consumption was 0.81 (95% confidence interval = 0.67-0.98). The relation was greatest for tumors of postmenopausal women and those that were not estrogen-receptor positive. Alcohol consumption was not associated with breast cancer risk in young women, but the effect was greatest for

postmenopausal women and those with
