To assess the role of vagal pathways in the ventilatory response to head-up tilt, the authors have studied the ability of vagal block to attenuate the ventilatory response to the onset of head-up tilt in seven subjects. One hundred minutes after a subcutaneous injection of atropine (0.015 mg/kg) or placebo, the subjects were placed in the supine position. Ten minutes later, they were tilted 30 degrees head-up for 30 minutes. Arterial blood gases were obtained at 15-minute intervals throughout the study, and the ventilatory response to tilt was calculated. Atropine significantly attenuated the ventilatory response to head-up tilt (P less than 0.05). In six subjects there was a small ventilatory response to isoproterenol, whereas the ventilatory response to tilt remained similar to placebo. The small attenuation of the ventilatory response to tilt after atropine was not associated with changes in arterial pH. These findings suggest that vagal pathways contribute to the rapid but relatively small ventilatory response to tilt. Vitellogenin II - a novel male-specific vitellogenin of fishes (Perciformes, Tetraodontiformes). Vitellogenin (VTG) is the precursor of egg yolk proteins in fish. Although there are reports of the identification of two or three

vitellogenins in some fish species, the fish Vitellogenin has not been well defined.

Recently, a novel male-specific vitellogenin (VTGII) has been identified in the striped snakehead, *Channa striatus*. The corresponding gene, *C. striatus vtg2*, was isolated and its complete sequence was determined. The gene contained a single exon of 599 bp encoding a putative protein of 198 amino acids with a high similarity to the corresponding protein of mammalian Vitellogenins. The VtgII protein had high similarity to the previously
