Key macros is an easy to use programming environment that provides you the tools you need to write macros for Microsoft Windows. In this environment, macros are basically small programs that perform some task, such as opening a web page in the Internet Explorer. The elements used in this app are the standard Windows.Forms, and all types of controls, including the Web Browser control. This app is highly customizable, and includes a set of predefined actions to perform. The main tool of the app is a macro tree, in which you can add actions, or nodes, which in turn have actions, nodes, etc. and this way build up your macro. This tree is fully expandable. Actions are added by dragging a node, and placing it at the place you want it. You can also define a sequence of actions. Actions are basically items of code that need to be added when performing a macro. Each action has a pre-set variable, and a set of parameters to be used in the action. This tool is very easy to use. You just drag a node, place it where you want it, and drop it. You have the possibility to change the input type, and the kind of parameters, at will. The developer of the tool also made it very easy to edit the files produced by the macro. The programming environment has a simple text editor to edit the actions, as well as the macros. Each action also has a parameter description, where you can define the parameter name, type, and the value that should be used in the action. You can also describe the parameter as User Defined, so you can define any data type, such as numerical, textual, etc. The standard installation of the trial version allows you to create four simple macros, and save them to the location specified. If you want to test all of the possible features, you need to purchase the full version of the product. When you buy this version, you get a license key that you can use for unlimited macros and macros files. This license key is the only one needed to edit the macros created with the trial version. The mac service is an interesting little app, that we've not heard about before. We found it by accident, when one of our contacts looked through the cronjobs section of the Mac App Store. It's worth checking out, as it allows you to schedule jobs to be performed on your Mac. So, for example, you could have a job 1d6a3396d6

Menu Builder Free

Create menus without writing any code. Save your time with editing standard elements, and master your creativity. Create unique, elegant and professional looking menus. Decorate your web pages with high-quality menus. Set your menus the way you want. Suitable for novice or advanced users. Vipre's opinion: It's no secret that programming a complex website or application is a rather difficult task for even the most experienced web developers. The process is mostly based on the creation of HTML and CSS code, which usually requires a detailed knowledge of both. We couldn't agree more with the opinion that almost any website can benefit from custom HTML and CSS coding. In this regard, we are excited to announce the introduction of a new tool called Menu Builder. Unlike many other programs of this kind, Menu Builder is not only a tool for creating custom menus, but also a powerful designer. The visual design is pretty neat, giving users a chance to add a wide range of elements, adjust their appearance, and master the chosen menu style. The online database, which is available for use with the tool, is rather complete and contains a large selection of beautiful themes and pictures. Also, the editor is rather intuitive, so that even beginners can set up their own unique, personal menu. Additional features include the option to save the generated code directly to your web pages. The generated HTML and CSS code is easy to copy and paste into any project. If you are already working on some projects, you can even make use of some sample menus you can find in the menu builder to get a glimpse of what can be achieved. A note about online availability: The online database is in beta mode. It will probably be extended over the coming weeks. Therefore, your menu may not be displayed in the system until we get some more presets and overall, the website is more stable. We are working on that. The rest of the website is in alpha, and is not yet optimized. However, we are going to take the best thing about Menu Builder, which is the visual design, and turn it into a regular website that will only benefit you as a web user. Bottom line is that Menu Builder is sure to help you design custom, cool HTML or CSS menus without writing a single line of code. The visual design is neat, letting individuals of all levels of experience quickly get the hang of things. Although rather poor in number of presets, there's a rich online library of themes, as well as a decent range of element customization options. Create menus without writing any code On launch, the application ask whether you want to create horizontal, or vertical menus. Choose carefully though, because you can not switch during the process itself, unless you start over. There are no import options, so all editing needs to start from scratch. A default layout is put at your disposal so you get an idea of what can be achieved. You go through three steps before you can generate a proper menu. First of all, elements need to be configured. This process requires little effort, with the side properties panel letting you add root, or submenu elements by simply writing down a name, and dragging them around in suitable positions or existing menus. Additionally, links and targets can be specified. Preset themes, and customization options On the visual side of things, several themes are at your disposal to make the menu look fancy. There's also an online database with a considerable amount of themes to try out. However, there are more customization options to be found in the designer tool. Here is where things get a little more complicated. The design tab lets you select all elements, or one by one in order to configure properties such as sector, size, background with picture option, repetition, position of background, border, corners, and a few more. All changes are reflected in real time in the preview area. When done, choosing to export lets you select a save destination for HTML files, also bringing up a result screen. This panel provides the necessary code you can directly copy and insert in your HTML or CSS projects. A few last words Bottom line is that Menu Builder is sure to help you design custom, cool HTML or CSS menus without writing a single line of code.
