From the moment that you connect to SQL Server using SQL Password, you will be prompted to type the password that you will recover. You will only have a very limited time to type your password. However, if you type a wrong password, the program will continue trying the password over and over. If you make a mistake by typing the wrong password, you will always get a wrong password message. If you type the right password, the "Password found" text in the status bar will change from red to green. Click "Next" to continue. Once you've entered your password, SQL Password will try to find some known passwords. If the first password is wrong, SQL Password will try to find the second one. If you want to try a different method, click "Next", otherwise click "Back". When a password is found, its name will appear in a list on the right side. Click "Next" to continue. After a password is found, SQL Password will check whether the account is unlocked for the user. If the account is locked, you will only be able to recover the password by resetting it to a known one, or by cracking it using another program. If you'd like to try to recover the password using a dictionary attack, click "Next". If you wish to use the brute force attack, click "Brute Force". The program will check the generated password on the database. If the password is correct, the program will save your new password and continue. If the password is incorrect, the program will ask you to check and correct the password. If the password is correct, click "Next" to continue. If the password is incorrect, click "Back" to return to the previous screen. If the password is correct, click "Start brute force attack". If you decide not to use a dictionary attack, click "Back".
