Q: max flow for multiple sources and multiple sinks Suppose we are dealing with a problem: Lets say we have the following graph with 3 sources and 3 sinks: 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 where, 0,1,2 corresponds to sources(S1, S2, S3) and 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15 corresponds to sinks(P1, P2, P3) I have an upperbound of 16 for this problem, i.e. capacity of pipes is 16. is this correct? A: Yes, correct - but the capacity is 1024. [Selective estrogenic action on the uterus: a pharmacological phenomenon]. The accumulation of uterine progesterone receptor, estrogen receptors (ER) alpha and beta, and phosphorylated protein kinase C (PKC) in the immature rat uterus after estradiol treatment were estimated by the ligand- and immunoblotting techniques. Estradiol (40 microg/rat) caused a rapid decrease in total progesterone receptor (PR) concentration in the uterus after 18 h. It also caused a decrease in ER alpha concentration immediately after the hormone treatment, and the decrease was the most rapid after 12 h. On the other hand, no decrease in ER beta concentration was observed even after 18 h. In the case of PR, the decrease in the receptor concentration was recovered by the addition of progesterone (1 mg/rat) together with estradiol. PKC was also decreased to about 20% of the control level within 30 min after the hormone treatment. It was shown that these effects of estradiol are selective; that is, estradiol could not change the concentrations of other proteins such as proliferating cell nuclear antigen, cyclin A, and cyclin B. Because uterine progesterone receptor was reduced in spite of the fact that progesterone was continuously added after estradiol treatment, it is assumed that the ER receptor complex was dissociated
