Ad Although AutoCAD's data structure and commands are similar to those found in drawing programs created by competitor software companies, AutoCAD was not the first CAD program for desktop computers. In the early 1980s, a variety of companies offered graphics programs that were commercialized versions of software created for the Apple II and other platforms of the era. One of the first commercial products available for the Apple II was CAD-1 from Signal 11 Inc., originally a subsidiary of Digital Equipment Corp. The ability to combine a computer and a graphic display terminal (or "mouse" and "graphical user interface" on Unix systems) made CAD

software useful to anyone who had the capacity to make use of a computer. A skilled CAD user could design major structures and mechanical assemblies that previously required the combined skills of a draftsman and an engineer. In addition, CAD enabled the user to visualize the designs and make corrections, saving time and cost in comparison to more traditional methods. The Time of First Release AutoCAD was the first widely available CAD program available for the Macintosh. "RATO" (right out of the box) was the term used to describe the speed with which AutoCAD was released for the Macintosh, meaning "ready to use" or "ready to operate". It was developed by Engineering Systems Inc., a small technology company formed around this time by several former employees of GE and Xerox, who had become interested in developing CAD software and decided to apply their previous experience to the new market opportunity. The Macintosh platform enabled Engineering Systems Inc. to release the initial version of AutoCAD quickly, but it was only after the software was released for the IBM PC platform that many users discovered what the company had hoped would be the first "killer app" for the Mac. AutoCAD quickly became the most popular CAD program for the PC. While IBM-compatible computers were the primary platforms used for the first few years of AutoCAD, the program continued to grow in popularity with Macintosh users. By 1993, AutoCAD for the Macintosh was one of the top selling software titles, and by 1995 it was the first time AutoCAD had sold more software units than AutoCAD for the PC platform. Features AutoCAD is a fully featured vector-based CAD system that can be used to create both 2D and 3D models. In AutoCAD, the term "vector" refers to the smooth curves used to create the final model rather than

References Category:Populated places in Bafq CountyQ: jQuery object performance difference between.on() and.live() I've got a list of items and each time a item is clicked I want to change the CSS of some others. If I use the.live() function, the performance is very good, but if I use the.on() function then the performance is very bad. The code is about 300 rows with 12 different items. If I use the.live() function, I get about 1 second between clicks. If I use the.on() function, I get about 30 seconds between clicks. Is it normal to have such a difference between two functions? And if it is normal, why? Thanks A: From jQuery 1.7 live() was refactored into on() and removed the default useCapture flag. To return to the old behaviour: $(function() { $(document).on("click", "a", function(e) { // do something }); }); A: I think it's because the on method is using bind which is better (see the bind() documentation). A: Yes, it's normal. What you are seeing is called the performance difference between.live() and.on(). When the user clicks on the item you are listening for, you attach a click handler to it via the.live() method. When the user clicks an item, you remove the handler from that item. When you click on another item you then add a click handler to that item which will trigger the handler you have already attached. When you use the.

Add visual layout information to a drawing, such as dimensional and text, by importing a table from Excel or Google Spreadsheet or exporting a text file. Use AutoCAD to add page number information to your drawing and incorporate layout information (such as page numbers and fonts) directly into your drawings. (video:

2:27 min.) Use the Markup Assistant to create a table of content for your drawing and to format images and drawings in PowerPoint files and publish to PDF. Easily edit and format images in PowerPoint, PowerDraw, and Acrobat PDF files to ensure your publication accurately reflects your AutoCAD files. (video: 4:37 min.) Live View: Use the selection command to improve your editing process. Speed up your drawing workflow by changing the default zoom level to 100%, then size the drawing window to 1:1, and show the scale bar. (video: 1:18 min.) Work with huge drawing files using the new live view feature to quickly annotate and interact with your design while working in the drawing. (video: 2:12 min.) Tag Editor: Simplify tagging and organizing items. Edit tag names to rename or move an item and tag the item as desired, then easily publish or discard your tags. Manage tag hierarchies and nest tagged items, as well as quickly move an item to a different tag. (video: 1:45 min.) CADManager: Schedule, organize, and maintain your drawings. Use the new CADManager to easily schedule, organize, and monitor drawings using a centralized repository. (video: 1:29 min.) Java: Install and activate your Java SE development tools, then install and test a sample Java application to ensure compatibility with your existing Java development environment. (video: 4:15 min.) List: Define rules to repeat blocks of text, object properties, and drawing elements in the drawing canvas. The List box enables you to specify the level of detail to which you want to apply a rule. (video: 2:40 min.) Solids: Get a planar representation of solids in your model with the new SOLIDS command. (video: 1:43 min.)
