What is AutoCAD? AutoCAD is a commercial, desktop CAD software application. It is known for its solid engineering drawings and is one of the most popular CAD packages in use today. It was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps. AutoCAD has an integrated set of features allowing the user to create a wide variety of 2D and 3D drawings. These include most common engineering design and drafting applications such as 2D drawings, 3D models and surfaces, construction and assembly, site drawings, tables and views. The history of AutoCAD and how it came to be Autodesk first released AutoCAD in 1982 as a software package for the MacIntosh and IBM PC compatible computers. The first three versions were a solid-modeling and drawing package for these machines. AutoCAD released a standard version of its Windows app with user friendly commands in 1990. Q: ReactJS - pass array to child component from parent component I am trying to pass an array from my parent component to a child component so the child component can use the values from the array. I am able to do this successfully by using: `import React, {Component} from 'react' class ChildComponent extends Component { render() { return {this.props.array[0]} {this.props.array[1]} {this.props.array[2]} } } class ParentComponent extends Component { render() { return () } }` I want to put the array in the parent component because my child component will require it. How can I pass this array to my child component? Is it even possible? A: You can pass the array as prop to ChildComponent. If the value of the array changes, you need to call `setState` on parent component to change the state and update the array in ParentComponent. `import React, {Component} from 'react'; class ParentComponent extends Component { state = { array: [0, 1, 2] }; render() { return (`
