Note With the introduction of the Elements upgrade to Photoshop CS5, the program is now known as Photoshop Lightroom. It's a powerful program for organizing, editing, and printing photos, and it has many of the same features of Photoshop. Just make sure that you've downloaded the Elements version before you run across Lightroom tutorials and tips in web sites and print material. * * * # Sharpen and Curves As you sharpen an image in Photoshop, you're essentially pushing out details and sharpening the contrast to define edges. You can sharpen an image in a variety of ways. The most common ways are by using the Sharpen tool or using one of the enhancements in the Filter menu. If you want to sharpen an image without adding contrast, use the Curves adjustment tool. The Curves tool allows you to manipulate the shape of the image to sharpen or desharpen an image. ## Using the Sharpen Tool The Sharpen tool is probably the most basic way to add sharpness to an image. It's easy to use, although it does have a few drawbacks. Figure 13-2 shows an image where the edges and highlights aren't as sharp as they could be. If you drag the Sharpen tool directly to the image area, you can see how it'll push pixels out from the image, pushing the image upward and extending and distorting the image. It can also push pixels in from the edges, although you can adjust the amount of feathering using the Amount slider. Figure 13-2. The Sharpen tool works as a contrast adjustment, distorting the image and pushing pixels out. To get rid of the extraneous sharpening, you need to manually click the Add adjustment layer in the Layers window and then turn off the visibility (make the layer invisible) of the Sharpen layer, as shown in Figure 13-3. At this point, you can click the Eyedropper tool in the Toolbox to add a new adjustment layer

Q: How to properly state this value which is a interval of 1,2,3...etc? I am having trouble articulating an ideas into correct mathematical form. I want to say: Suppose that there is a sequence of numbers $1,2,3,\dots$ such that it's length is n . Then is there an n such that the length of the sequence is an exact n ? Now, I can imagine having some sort of induction process saying that for $n=k$, there is such an n and then assuming that there is some n such that the length of the sequence is n , and using algebraic manipulation to derive the formula for $n=k+1$, but I am getting stuck trying to translate this to math form. edit This is the general problem I am trying to explain. Say that there is a sequence $1,2,3,\dots$. Let the length of the sequence be n . I want to know if there exists an n such that the sequence has exact n for the length. Thanks A: If you are looking for a solution for every $n \in \mathbb{N}_0$ then the answer is $\exists n \in \mathbb{N}_0: n = 2 + \lfloor \sqrt{n+1} \rfloor$. Q: Auto turn text input to date on focus? I want the text box to be date format upon focus. But the auto change takes time to pop up the textbox using placeholder property in the html. Any work around for that? I have set the autofocus property on the text box too. A: You can use jQuery to set the value of the text box to the current date. `$(function () { $('#date').attr('placeholder', new Date().toLocaleDateString()); });` LONDON (Reuters) - Politics and money are dividing F1 drivers, who are unhappy with the exclusion of the likes of Max Verstappen and Pascal Wehrlein from the sport's top table in its meetings with the FIA and governments. What's New In?

The Writing and Arithmetic of the English Dialect. Article The Writing and Arithmetic of the English Dialect. by Stephen Green I have often been surprised that so little has been said about the dialect of the minor poets, especially amongst those who profess a reverence for Blake and Burns and their ilk. But in other fields there has been a tendency to discriminate in favour of all things Saxon, Saxon, as though there were no other way of being English. The Early Christian Era was a Saxon decade and it is certain that a great many readers still cling to that Saxon look. Recently we have seen the impact of a new (but really old) movement, the English Renaissance movement. Those who are engaged in this move know, of course, that the fourteenth and fifteenth centuries were called the Golden Age of English Literature. They do not assume that this has to do with our own era in Britain in some way. In the movement towards the Renaissance, there has always been a fashion for learning English in a Saxon manner. Many of the old poets, Blake, Burns, Keats, for instance, would be appalled at such an attitude. When someone like John Loveday sings, "I'll be with thee to the end of the race" he means the race with the Renaissance. It is not 'tomorrow', but 'some day'. Now to turn to the question of the Early Christian Era. The primary grammar of that period was what is called Old English; it was taken over in its essentials from the Anglo-Saxons. The verb should and had the present tense; the verb from to be to 'be' in the past participle; and the verb to do to 'do' in the present participle. These were taken over in the Norman Conquest from the Anglo-Saxons. But they were also influenced by the Latin and French of the Normans. In any case the grammatical forms of this period are not very helpful for modern readers; they still seem to us a foreign language. Yet the literary people of the Early Christian Era could read and write easily. They wrote in English and they could read English, and they could read and write poetry. The people at that time of course were not philosophers or poets; they were, in a general way, clerks. In general they were interested in arithmetic and in astronomy. Calculating and writing were of the greatest practical importance. For this reason we do not find much grammar
