Note The Open dialog box opens in the background so you can see what you're doing. If you'd prefer to see a Save dialog (Saving Files) box that sits on top of the Open dialog box, you can do that by pressing the Alt (Windows) or Option (Mac) key while choosing File→Open. 2. **Use the dialog boxes to navigate to and select an image file you want to work with**. The file's size is listed in the dialog box, as shown in Figure 2-11. You'll most often import image files from a digital camera (JPEG, TIFF, or some other format). You may also import image files (usually.png or.tiff) from a scanner. Figure 2-11. The Open dialog box offers you several ways to import a file. If you have a file open in a different program, you can use the "open with" menu to use that program to open your image. You can also navigate directly to a folder or other files. For example, if you have a folder of images on your hard drive, you can select that folder and choose Open to display the Open dialog box with those folders. To open multiple files in a batch, just click the Open button. If you don't want to choose a file to import right now, right-click (Windows) or Control-click (Mac) the Open button and choose Open

Massive pulmonary embolism after spinal cord injury. Two cases of massive pulmonary embolism (PE) following spinal cord injury (SCI) are presented. The first was a previously healthy 22-year-old male who had an anterior SCI resulting from a road traffic collision. The second was a 34-year-old male whose injury resulted from a suicide attempt. Their pulmonary emboli, which were discovered during evaluation of chronic right-sided abdominal and leg pain, were massive in both cases. Transesophageal echocardiography showed right-to-left shunting. Treatment in both cases included thrombolytic therapy, followed by anticoagulant therapy.

Neuroleptic-induced weight gain is not related to metabolic abnormalities in schizophrenic patients. Patients with schizophrenia are often described to be at a metabolic risk. This study examined whether patients with schizophrenia who experience weight gain during neuroleptic treatment also show metabolic abnormalities. Results of this cross-sectional study showed that in a group of 20 patients with schizophrenia, increasing body mass index (BMI) from 19.5 to 30.8 kg/m² during a course of neuroleptic treatment was not associated with an increase in fasting glucose ($p = 0.21$), insulin ($p = 0.37$), and C-reactive protein (CRP) ($p = 0.91$). No gender differences were found for weight gain ($p = 0.81$), insulin ($p = 0.17$), and CRP ($p = 0.79$). Neuroleptic-induced weight gain in a group of 20 patients with schizophrenia was not related to abnormal metabolic parameters.

Molecular interactions in protein extractable waters of food matrices during accelerated storage and cooking. Mechanisms of changes in water structure and food compounds under the influence of temperature and heat treatment were examined. The effects of temperature and temperature/heat treatment on water structure of alginate and starch were compared by testing Raman spectra of extracted waters, by analyzing thermograms of films of these foods, and by measuring the structure of heated samples. The results indicated that the temperature had a greater influence on water structure than the presence of heat. The effect of temperature is also greater in complex foods. Lamellar water presents in alginate and starch increases as the temperature increases. The effect of temperature on secondary water appears as dipolar-to-octadipole water at room temperature in alginate, but as

The post-translational modification of the hepatitis C virus E2 envelope glycoprotein by the ubiquitin-like protein SUMO-1 is essential for its infectivity and downregulates the innate immune response. The E2 envelope glycoprotein of the hepatitis C virus (HCV) is involved in the entry process of the virus and the regulation of the immune system. We found that the attachment of the ubiquitin-like protein SUMO-1 to E2 enhances its infectivity and induces partial downregulation of the innate immune response, possibly via the inhibitory effect of E2 on the function of the NF-kappaB and IRF3 transcription factors. SUMO-1-E2 chimeras were constructed and their respective activities studied in a cell culture model to identify the amino acid region involved in SUMO-1 attachment and function. The results indicate that the hydrophobic region of the glycoprotein designated as domain III (residues 418-500) is not involved in SUMO-1 binding, but is necessary for both the enhancement of virus infectivity and the downregulation of the innate immune response induced by E2. The cysteine (Cys) at amino acid residue 511 of E2, present in SUMO-1, is responsible for the attachment of the small polypeptide and appears
