While Photoshop is a very powerful program, it can be time consuming to learn how to use it. I am willing to bet that you will only use 10 to 15% of the program. I suggest that you first learn the editing basics, that is, the most basic of the editing functions, and then learn how to enhance and embellish your images with various layers. Illustration by Kekai Huang Illustration by Kekai Huang Finding Photoshop As with everything else, you don't have to spend a lot of money to have a powerful version of Photoshop. You do, however, need to spend a lot of time to

learn it. The most powerful version of Photoshop is CS6. It was released in 2012. CS7, which is the next version of Photoshop, is also a great program and costs about $600. It's the same price as a new Mac laptop, so it's not really a big investment. If you have an old Mac that's running OS X Leopard or Snow Leopard, you may be able to run Photoshop CS6 on it. However, you'll need to find and download the necessary 32-bit plugins. CS7 will run on a Mac with Snow Leopard, but you won't get the same performance. You'll find various other versions of Photoshop for a range of prices at your local computer store. In fact, it's possible to buy Photoshop CS5 on DVD, though not necessarily at your local computer store. If you buy it from a computer store, you'll have to pay the shipping to get it to your computer, but if you buy it on DVD, it may

be a handy reference with an instructor and the program files on DVD. If you have a digital camera, you may want to check out Photoshop Elements, which is a program designed to help you with your photos. It includes many editing features, including basic photo retouching features. Designing Your Workflow Photoshop is a complex program, but, fortunately, the actual editing work is usually not too time-consuming. In fact, some of the tools you use are more time-consuming than others. If you simply want to alter a few pictures, you can do that quickly. If you're designing a new billboard or a billboard that has thousands of pixels in the image, you'll have to spend more time and have fewer tools at your disposal. We all have different needs and preferences when editing photos. The following sections

This tutorial is about learning the basics of the Graphics software called Photoshop. It will also include some basic tutorials on using Photoshop as a graphic design tool. The first thing to do is to load the image that you want to edit onto Photoshop. First, you need to give your image the best possible look using the best tools in Photoshop. With the first step, you can start making the picture live with your hands as soon as you open the image, because you can make the image look better and simpler in the right way, see the direction of the image with color composition tools, light and shadow, add some interesting details, and even add extras to the image. There are many tools available to make an image look more beautiful with colors, shadows, and

textures. In this way, you can make your pictures, videos, and videos look more interesting and attractive. Step 1: Place an Image in Photoshop To start with, you need to start with Photoshop. Open your file, click on the Create a new document. The document screen appears. Creating a New File In the new document box, enter the name for your document. Click Save to open the Save dialogue box. Creating a New File With the Save dialogue box open, you may see other options in the Save dialogue box. The Save Dialogue Box Check the boxes to save your document. You can choose "Save a copy in JPEG format" and "Save a copy in PNG format" for your picture. Click OK. You will get the image you chose, added into your computer. Step 2: Adjust the Sliders for Color To start, go to Image > Adjustments > Colors. An adjustment panel opens,

showing the sliders in colors of the image. The Colors Panel Adjust the Black and White sliders to get the best result. The left side of the image is black, and the right side of the image is white. After you adjust the slider, preview the image to be sure the image is the way you want. The Black and White and Brightness/Contrast sliders You can add more detail to the image by moving the sliders. Move the black and white slider to the right, and the brightness/contrast slider to the left. Step 3: Adjust the Exposure Go to Enhance > Adjust Lighting > Expose. An options panel opens. Q: Converting VB.NET to C# I have a project using VB.NET. I was wondering if it would be possible to convert it to C#. I have been making some progress but I am now stuck. I am trying to use pInvoke to create a Win32 window so it must be an exe and not a dll. So far I have: [DllImport(Kernel32.dll)] public static extern IntPtr LoadLibrary(string lpFileName); Is there a way I can use a WinForm? Thanks in advance Edit: Thanks to @Joel Coehoorn I have finished the first part of my project. I have got it working. It basically has a list of items with a checkbox next to them. The program opens the list of items in a new form. I am now trying to make it back to the original form. I am still stuck on this, I don't know how to re-insert the data.

[DllImport(Kernel32.dll)] public static extern bool FreeLibrary(IntPtr hModule); private void button2_Click(object sender, EventArgs e) { string szFileName = @"C:\Users\malc0145\Desktop\Test\Data.ini"; IntPtr pb = LoadLibrary(szFileName); if (pb!= IntPtr.Zero) { FreeLibrary(pb); } MessageBox.Show("Loaded"); List items = LoadItems(); Add(items); } I have added items to the list and now it is supposed to open the list in a new form. I then want to add a few more items and close the form and re-open the program so it all keeps in sync. Thanks for any help. A: Your Add method that loads items from a file is implemented using a Win32 function, LoadItems. The documentation for this function is found here: LoadItems. The documentation for the pInvoke function LoadLibrary is here: LoadLibrary. The documentation for the pInvoke function

FreeLibrary is here: FreeLibrary. Those are the

Q: Is there a way to show a blank slide in PowerPoint? I am writing my first Java application for PowerPoint. I want to be able to create a blank slide and display it during PowerPoint presentation. I do not want the slides in presentation to be populated. Is there a way to do that? I came across this post: Change the image of a PowerPoint slide programmatically I tried the options suggested in the answers, but they do not work on my PowerPoint 2010 versions. I use PPT 2010 in Windows 7. I have also tried ShowSlide(SlideShow.SHOW_CONTINUOUS); before inserting slides in the presentation, but it also results in empty slide. A: You can use the

SlideShow.ShowSlide method. The parameter for this method allows you to insert a slide with the value 'continuous' meaning that you can insert a new slide at the same time as you change the slide show. In your code you can therefore do something like this: SlideShow slideShow = PowerPoint.getPowerPoint(); slideShow.ShowSlide(SlideShow.SHOW_CONTINUOUS); Slide newSlide = slideShow.InsertSlide(1, "New slide 1"); Comprehensive nuclear chemical analysis of treated and untreated reclaimed water to mitigate risks from radioactive contamination in potable reuse schemes in order to mitigate associated public health risks. Whilst reusing treated water to address drinking water scarcity challenges, particularly in South Africa, are of increasing interest in all countries, some countries have gone further by developing local treated water recycling schemes.

Reclaimed water from these schemes may become contaminated with radioactive elements. This could therefore increase radiological risks to consumers. In view of this, South Africa established its Water Reclamation Regulations under the Environmental Management Systems Act, the terms of which define what constitutes treated recycled water for reuse purposes and that it may be further treated to mitigate radiological risks. This study presents the results of a comprehensive nuclear chemical analysis that was performed on a sample of the reclaimed water treated by the KZN Water Reclamation Projects and untreated reclaimed water to assess possible radioactive contamination that may result from the release of treated wastewater into the environment. The individual and combined radiological and chemical risk

levels associated with these reclaimed water types were determined. The results clearly indicate that the radiation dose resulting from the reclamation of wastewater is
