What do you think about the article "A guided tour of the organisms that drive the world's largest ocean communities" published in volume 8, issue 6 of the Journal of Experimental Marine Biology and Ecology? There are three main sections: organisms, impacts and conservation. Some comments on the sections are summarized as follows: Most organisms in the world's oceans are tiny and only several millimeters long; they make up half of the total biomass in the oceans. We chose to write about large animals to emphasize that the largest animals are not necessarily the most abundant, most abundant animals. Small and poorly studied organisms are key components of the food web in the oceans and are important in regulating the whole ecosystem. Few animals are hunted commercially, but many are important prey for other animals. Therefore, their conservation is often a priority. The changes in ocean ecosystems due to human activities are enormous, affecting all of the major dimensions of the ecosystem (freshwater-to-ocean food webs, health of corals, phytoplankton, fish, seabirds). Did you find the article interesting? Have you ever been to the ocean? What did you see or do? Please give your opinion in the comment section below and share the article with your friends!Ergonomic assessment of laboratory tasks: a comparison of three methods. A major purpose of ergonomic evaluation is to establish the amount of time workers spend in various parts of the workstation and to determine whether any modifications will alleviate musculoskeletal problems. In practice, several evaluative techniques are employed to accomplish this purpose. Recent evaluations have been based on quantifying time, measuring torque, torque rate, moment, or force. These require laboratory-based measurements to be used; however, ergonomic problem solving and evaluation can be accomplished in a remote setting using a video-based technique. This paper compares these two methods, and the third method evaluated is the use of time-motion analysis (TMA). This technique was developed primarily for the purpose of identifying the time spent in various tasks by an individual. This comparison will describe each technique, its advantages and disadvantages, and a possible solution for the disadvantages.Statistics Canada has released a three-year report on drugs policies.
