However, we humans see color in a slightly different way, so we'll explain how colors work in a bit more detail. The RGB color scheme is a three-color system that uses three values for each of the three colors in a color wheel. If you need to re-create a color in Photoshop that you see in a picture, you start by choosing the RGB color. You can also enter RGB values into an RGB color using the Info palette. If you look at a color wheel, you'll notice that colors are not distributed evenly; instead, they follow a pattern, as shown in Figure 1.24. You can see that these colors look brighter at the top, which the human eye assumes is where light comes from. The color wheel is one of the more complex visual representations you can use to help you understand color. If you need to get more educated about it, there are several books available on the topic. \*\*Figure 1.24\*\* : Using the HSB color wheel to understand color The HSB wheel provides a more visual explanation of what the RGB color values mean for each of the three components of a color. In a nutshell, the H represents the brightness and saturation of the color. The S is the saturation and the B is the tone of the color. When you select an RGB color, you can see an approximate representation of that color in a sample window. You can view the color using the Info palette, which we will discuss a bit later. One of the differences between Photoshop's Channel Mixer and the RGB color wheel is that the Channel Mixer can be used to mix and match the color components to create more intense colors than you can with the RGB color wheel. The Channel Mixer will be discussed in Chapter 5, "Color Modes and Adjustments." For now, you'll learn how to

Study: Drugs Linked to Becoming Maternal NEW YORK (AP) — Drugs taken by pregnant women or prescribed to their babies could be linked to a higher risk of developing autism, a new study suggests. The research published Thursday suggests the risk of autism increases if a mother was exposed to drugs while pregnant or if the pregnant woman was prescribed certain anti-depressants. Experts and women in the study noted that the effects of drugs on fetuses and children have not been well-established, and that the findings do not mean that drugs cause autism. The study involved as many as 1,100 mothers in Norway who were given mental health surveys. The researchers found that mothers who took at least one drug in the first three months of pregnancy were nearly 50 percent more likely to have a child with autism or a developmental disorder than mothers not taking any drugs during pregnancy. The study also found that mothers who took drugs after they gave birth were more likely to have children with autism or developmental disorders, but they did not have a higher risk than mothers who were not prescribed any drugs. The researchers suggested the link might be because mothers who took drugs may have needed to be treated for conditions that sometimes make children autistic. Kristine L. Pruksch, a psychologist at the University of Calgary in Canada, said it is not clear whether the mothers used the drugs for depression during pregnancy or after, but the chance of becoming depressed during pregnancy is higher if one was previously depressed. "The question is whether that's what actually is triggering autism or whether it's something else," Pruksch said. "It's very hard to tease out," said Mark Obert, a pediatrician at Johns Hopkins University and director of the school's Center for Autism and Pregnancy Research. "We think it's not really genetic. It's more about the mother's ability to be good and stay well and protect the child during this critical period." Dr. Diana Elkins, a psychologist at the University of Michigan, said the study reinforces the need for safe drugs for pregnant women and children. "We have good reason to be concerned with drugs in general," Elkins said. "And we should be aware of the emerging research on that topic." Elkins said if drugs are used to treat serious illnesses, doctors would be expected to prescribe the safest and most effective treatments for the mother and baby. The study also included mothers who were prescribed anti-dep

The data means the economy is currently only just meeting the Bank of Japan's growth target of 2 per cent plus for the year, a feat it has not achieved since before the March 2011 earthquake and nuclear crisis. Ahead of release of the second quarter data, government officials hinted that the Boj will

need to ease policy further to achieve the target. The government forecast growth of 3.0 per cent for the full year, with a range of 2.8 per cent to 3.4 per cent. The median estimate of 26 economists surveyed by Bloomberg was 3.1 per cent. The government's statistics agency said there was a decrease in the yen's value, partly as a result of foreign investors buying assets abroad that were more likely to increase in price when the currency moves. It also benefited from a surplus in the first quarter, while farm income and the value of consumption based on household data surged. A stronger yen is the "major threat" to the economy, Deputy Finance Minister Akihiro Ohira said after the data release. "If the trend in the yen continues, the economy will be weaker." Domestic spending rose 3 per cent from a year earlier in the quarter, surpassing analysts' forecasts in part because of strong purchases by households and firms
