This invention relates generally to the field of communications and more particularly to the field of stereophonic communications. The growing number of subscribers to cable, satellite, and other multiple channel cable TV systems has resulted in the construction of larger and larger passive multichannel distribution networks. As the channels become distributed over more channels, there is an increasing need to be able to match the distal end of the system (the subscriber end) to the proximal end (the cable TV plant) of the system. Stereophonic communications in general and such as have been proposed for use in cable TV systems are not limited to systems using a passive distribution network. All of the following publications are incorporated herein by reference, the descriptions of the inventions,

descriptions of the background art, descriptions of the current inventors knowledge of the current state of the art, and statements of object and advantages of the inventions, are not intended to be exhaustive, but rather are subject to further interpretation by one skilled in the art: U.S. Pat. No. 4,718,078, of M. Gilson et al., discloses a method for calibrating time base error and chroma sampling in a broadcast TV system utilizing a satellite link between a satellite uplink and a plurality of simultaneously broadcasted VHF/UHF signal streams. All of the channels are simultaneously broadcasted in a low band, a middle band, and a high band. U.S. Pat. No. 4,721,883, of R. Campbell, discloses a system for encoding and decoding a plurality of audio programming channels within the bandwidth of a single TV channel by utilizing the spectrum of the TV channel in which the plurality of audio programming channels are inserted. U.S. Pat. No. 4,617,754, of J. H. Daub

et al., discloses a system for replacing the TV broadcast video with a program of digital data in the bandwidths of the first, second, and third, RF carrier frequencies of a cable TV channel. U.S. Pat. No. 4,578,807, of J. C. Kantor et al., discloses a system for transmitting a plurality of audio program channels from a satellite uplink to a plurality of downlink terrestrial stations, each of which receives and transmits the audio program to a subscriber by way of a coaxial cable. Multiplying constant refinement In model theory and the theory of stable groups, the multiplication of constant refinements (or multiplication of one constant to infinity) of a finite structure is an operation on models of. The operation is associative. The operation of

multiplying one constant to infinity for a model and a definitional expansion of is an operation where is the expansion of with all the definitional atoms in augmented with the set of definitional atoms of. If does not contain a constant symbol (that is, is a model), is then defined to be the largest model that includes. In an algebraically closed field, this multiplication is equivalent to the connective sum. References Ursula Chernikov and Hendrik D. The neural mechanisms that allow one side of the body to be operated from without

actual somatic input are not completely understood, and cerebral specialization for the processing of lateralized information is not well defined. Using fMRI and threshold measurements, we tested the hypothesis that the processing of visually presented lateralized stimuli in the human brain is related to the hemisphere of cortical activation. We presented visual stimuli to the right or left hemisphere using a prism and measured threshold stimulation levels for a finger-tapping task, at which subjects were completely unaware of the lateralized stimulation they received. We found that a larger fraction of the cortical activation (percent of maximal activation) occurred for lateralized stimulation to the right and left hemispheres in the prefrontal and parietal cortices of the left and right hemispheres, respectively. This finding supports the hypothesis that right hemispheric lateralization is a critical factor for selective attention and

motor control, consistent with previous lesion and neuroimaging studies. The finding that left hemispheric lateral
