And here is another from my collection: . It will detect the PC at first run and ask you if you want to add or edit a network location: . After running you will be prompted to select a directory for the Logs that will be saved: . On my Windows 7 system I then specified a directory on my desktop. . And finally I set up the Logging: . . Logging works as advertised, with the Logs being saved and can be opened in Notepad or any other text editor program. . It is all very well but it has one weakness. . . The problem is that the Logging cannot co-exist with other software. For example, Notepad is an essential part of Windows and is installed with every copy of Windows and cannot easily be removed. . . So it would not be a problem if the Logging program was as intelligent as this: . . . In this instance the Logs were just saving to the desktop from where they were opened. . . If the Logs were to be saved to a network directory they would have been saved to the network drive from where they were opened. . . The programmers or distributors of this software have not made it easy for users to copy a log to a directory on a network drive. . . So I think I will write the software that makes it easy for users to do this. . . Hoping this is of some assistance to anyone who wants to do this: . . A last thought to this software: . . Those who just want to look at the logs can download this:Q: How to draw a full "3D Graph" in Excel with R code? This is my data. I want to draw the graph in 3D in Excel in R language with this code: `set.seed(42) N=nrow(mydata) mydata`
