gene regulation and expression at the level of transcription are essential to understanding gene function in the context of development, and the response of cells to environmental cues. transcription is controlled by a combination of a number of transcription factors, which bind to specific sequences of dna. the activity of a transcription factor is regulated by the activity of other transcription factors and by other non-transcriptional factors. the first part of the textbook is meant to provide readers with a firm knowledge of the most important and fundamental concepts of the bayesian inference. this part includes chapters on bayesian belief networks (bbs), the bayes theorem, bayesian networks, bayesian estimation, bayesian inference and, finally, a chapter on bayesian software for econometrics. the book provides a theoretical background, that is, it shows how the fundamental concepts of bayesian inference are combined to provide bayesian econometric solutions. [] the main aim of the second part is to illustrate the concepts and procedures by using different real-world data sets, that is, using data from the us census bureau on health insurance coverage, from the eurostat on unemployment rates and from the world bank on human poverty. [] on the other hand, the chapters of the first part provide the reader with a thorough background knowledge and understanding of the bayesian econometric methods that are needed to build the models in the second part. [] by using three different data sets, the second part shows how data sets with different types and sizes can be used to illustrate the topics of the book. [] the second part also includes a chapter, which gives an insight of how to design and implement efficient and stable bayesian econometric software packages. [] finally, the third part of the book includes two chapters on different approaches to bayesian modeling. [] the first chapter is a continuation of the second part and covers fixed and random effect models. [] the second chapter is meant to introduce readers to bayesian model averaging (bma). [] in addition to the chapters of the first part and the first part of the second part, the book includes a concluding chapter on bayesian econometrics with a description of important topics, such as choice of priors, the effect of prior on the posterior distributions and the effect of model specification on the inferential process.]

In this paper, we critically analyze how the concept of negative knowledge contributes to the understanding of professionals expert practice and learning. Negative knowledge is experientially acquired knowledge about what is wrong and what is to be avoided during performance in a given work situation. In terms of its theoretical foundation, the concept relates to constructivist theorization and metacognition. Building on existing conceptions of negative knowledge, we systematically relate the concept to research on expertise and learning from errors. The theoretical discussion will be based on the example of the so-called reflective process. This example of negative knowledge will serve as illustration and illustration for the concept of negative knowledge. Theory and policy-related literature link the notions of negative knowledge and its epistemic consequences to our understanding of experts and expertise. In this paper, we critically analyze how the concept of negative knowledge contributes to the understanding of professionals expert practice and learning. First, we address a brief overview of the concept of negative knowledge. In this section, we address several elements of the concept of negative knowledge. In these contributions of Oser and Spychiger, negative knowledge is always linked to specific research areas or, as in our case, professional training within a certain field. Knowledge, which is required by students is typically positive. However, as the authors demonstrate, negative knowledge might also have a profound impact in training situations in domains, such as teamwork, procedural skills or organization. Two contributions of (Ericsson et al. 2006 ) focusing on expertise development, are particularly relevant for understanding negative knowledge:
