This would be the root of all of your Visual Basic 6 apps. I've received different tips in regards to the path to the folder where the libraries should be installed. We shall find out if this is the correct one later on. At first, we copy the entire Visual Basic 6 Library folder to a new path. We will be able to find all of our Visual Basic 6 related libraries in there. If you haven't done that already, we need to do it now. But we need to do it in Step 8 as well. Right click on the VB6 folder from the root of the VB6 Kit and select Move. Navigate to the location of your new installation of the VB6 Kit. Once you have successfully installed Visual Studio 7.0, you should install the latest Service Pack which is Service Pack 6. As of the writing of this article, you could still download SP6 from Microsoft's website, click here for more details. Extract the files to a folder on your Desktop, and right click on the file SETUPSP6.EXE follow the same steps we did under Step 3 for SETUP.EXE and change compatibility to Windows XP (Service Pack 3), and run the executable as Administrator. Follow the prompts to complete the installation. This will be the root of your Visual Basic 6 projects. You should move all of your project folders in the root of your VB6 Kit folder, to this folder. Again, we will copy all of the VB6 Tools folder to the new path. We also should copy the folder with our Visual Basic 6 Code before any further actions. This folder is where Visual Basic 6 stores the project files. If you want to see what its full name is, you could open any of the Visual Basic 6 code files (like [Vb6.Properties]) and find out what its full name is.
